

rv, ri source maps use no_grad

Faithfulness check: this figure follows KeypointCentricLoss and evaluate_keypoint_retention: KeyNetResponse is frozen, rv/ri are source targets under no_grad, rf supervises fused output, and total loss backpropagates to the fusion model.

The trainable network block has a vector fire icon at the bottom right. The frozen KeyNet block has a vector snowflake icon at the bottom right, as requested.

Connector convention: green = forward/evaluation, red = backward/update, blue = source inputs, gray dashed = frozen or stopped-gradient boundary.
